Overview of all bases for breeding values

Introduction

This document describes the situation since April 2024, which bases are used, which base differences do exist, and which animals are published on which base.

Definition of the four bases

On which base the breeding values of an animal are presented depends on the breed and colour of the animal. Starting April 2015, the name Black & White base has been replaced by Milk goal Black. The Red & White base is now called Milk goal Red, and local base was changed to Dual Purpose. Besides that, a new base has been added to the existing bases, this is the Belgian Blue base.

For traits like milk production, somatic cell count, conformation, milking speed, temperament, fertility, calving ease, beef traits, udder health, urea, persistency, rate of maturity, automatic milking traits, calf survival, claw health and longevity, breeding values are estimated simultaneously for cows and bulls using an animal model. For breeding values estimated with an animal model the following base definitions are used:

Milk goal Black (Z)

Herd book-registered cows born in 2019 with at least 87.5% HF-blood and up to 12.5% FH-blood and hair colour black pied, with at least one observation in the genetic evaluation.

Milk goal Red (R)

Herd book-registered cows born in 2019 with at least 87.5% HF-blood and up to 12.5% MRY-blood and hair colour red pied, with at least one observation in the genetic evaluation.

Dual purpose (D)

Herd book-registered cows born in 2019 with at least 75% MRIJ-blood and 25% or less HF blood, with at least one observation in the genetic evaluation.

Belgian Blue (B)

Herd book-registered cows born in 2019 with at least 87.5% Belgian Blue-blood, with at least one observation in the genetic evaluation.

An observation in the genetic evaluation can be:

| Milk production: | test day record |
|---------------------|--|
| Somatic cell count: | test day record |
| Urea: | test day record |
| Conformation: | classification |
| Milking speed: | a score |
| Temperament: | a score |
| Claw health: | a score for a claw disorder |
| Fertility: | an observation for one of the fertility traits |
| Beef index: | slaughter record |
| Udder health: | an observation for one of the udder health traits |
| Automatic Milking: | an observation for one of the automatic milking traits |
| Calf survival: | an observation |

The Belgian Blue base is only determined by Belgian Blue animals for fertility, calving ease traits and beef index. For all other traits, the base formed by the Dual-purpose animals is used as reference.

The animals forming the Milk goal Black base determine the standard deviation for all bases, for all traits where cows determine the base and the breeding value of a trait is expressed as a relative breeding value. The advantage is that only a difference in level exists between bases and no difference in standard deviation.

| Trait | Cow base | Cow base | Cow base Dual | Cow base BBL |

Table 1. Overview of bases used for different traits.

Base differences per April 2024

For all traits for which breeding values are published, differences in bases exist. In Table 2 the differences between the four bases are shown.

Note. The NVI is not in this Table. This is because of the differences in the formulas used to calculate these traits between different bases. The differences are therefore only to be calculated using the underlying formulas of the traits per base (see relevant E-chapter). Unknown base differences are indicated with '-'.

Table 2. Base differences between Milk goal Black (B), Milk goal Red (R), Dual purpose (D) and Belgian blue (B).

| Trait | kind | Base difference ⁽²⁾ | | | | | |

(1) C=cow base, B=bull base

(2) Z=Milk goal Black, R=Milk goal Red, D=Dual purpose, B=Belgian Blue

(3) Muscularity is only published on Dual purpose and Belgian Blue base.

(4) For the conversion of these trait first the underlying traits are converted, then the formula to derive the trait must be applied. The given base differences are an indication and only hold for the total population (not for an individual animal).

When converting indexes like INET, overall conformation traits, fertility index, calving index, and udder health index, first the underlying traits are converted before applying the formula for the index.

For the conversion of fat, protein, and lactose percentage, first the breeding values for milk yield, fat yield, protein yield and lactose yield are converted before applying the formula:

 $F_{\%fat} = \frac{F_{kqf} * 100 - F_{kqm} * P_{\%fat}}{F_{kgm} + P_{kgm}}$ $F_{\%protein} = \frac{F_{kqp} * 100 - F_{kqm} * P_{\%protein}}{F_{kgm} + P_{kgm}}$ $F_{\%lactose} = \frac{F_{kql} * 100 - F_{kqm} * P_{\%lactose}}{F_{kgm} + P_{kgm}}$

in which:

- P = average production of the base animals for the given traits;
- F = breeding value: kg milk, kg fat, kg protein or kg lactose, % fat, % protein or % lactose.

Values for P and F can be found in Table 6 in e-chapter 'Milkprodution'.

Base differences mentioned in Table 2 for INET, overall conformation traits, fertility index, calving index, udder health index, fat and protein percentage are an indication and should not be used to convert breeding values of animals from one base to the other.

Which breeds on which base?

On which base breeding values of an animal are published depends on its breed composition and with some breeds also on the hair colour. When determining the base for an animal the following rules are used:

An animal is published on the Milk goal Black base:

- Black & White Holstein possessing at least 5/8 Holstein genes.

An animal is published on the Milk goal Red base:

- An animal belongs to a dairy breed and has a minimum of 62.5% genes of the following breeds: Red HF (If HF, coat colour red), RDC (=ZRB, NRB, DR, GUS, AYS, ANG), BSW, Jersey, Milking Shorthorn, Normande, Montbeliarde.

An animal is published on the Belgian Blue base:

- Animals with 5/8 Belgian Blue and/or West Flemish Beef breed and/or Verbeterd Roodbont.

All other animals are published on the dual-purpose base.

Table 3 shows which breed is published on which base. For a dairy breed it is possible that an animal is published on Milk goal Black base or on Milk goal Red base. This depends on the hair colour of the anima.

Table 3. Bases for publication of breeding values for different breeds. B= Milk goal Black, R= Milk goal Red, D= Dual Purpose, B= Belgian Blue.

| Nr | | Breed code | Basis |
|----|----------------|------------|-------|
